**RE: Benning Road Generating Station – NPDES Permit No. DC 0000094
Metal Excursions– Outfall 013Q**

Dear Ms. Hopkins,

This letter is a follow-up to the September 30, 2013 telephone notification, made on behalf of Pepco Energy Services, Inc. by Ms. Heather Brinkerhoff of HB Consulting LLC., to report daily maximum copper and zinc excursions from a storm water grab sample taken on September 12, 2013 from Outfall 013.

On September 30, 2013 Ms. Brinkerhoff received the laboratory analysis indicating that the daily maximum concentrations for copper and zinc were exceeded. Ms. Brinkerhoff made the required telephone notification to the US Environmental Protection Agency (EPA) in accordance with NPDES permit condition VI.6.

The results of the laboratory analyses for copper and zinc are shown in the following table:

Analyte	Units	Permit Limit Daily Max	Results
Copper	ug/L	13.44	35
Zinc	ug/L	117.18	160

As discussed in our prior correspondence, on July 19, 2010, the facility submitted a TMDL Implementation Plan to EPA as required by the facility's NPDES permit. The TMDL Plan provided information on past, current, and planned activities at the facility to meet the required load reductions for the Anacostia River TMDLs for metals. EPA approved the plan and the facility completed the implementation of Phase I (inlet maintenance) and Phase II (metal management) control measures as of December 2012. This included installing metal absorbing filter guards in storm drains throughout the

facility; installing sediment removal and oil absorbing booms around storm drain inlets; and removing or covering stored metal and equipment exposed to the weather.

AMEC, our environmental consultant assisting with the implementation of the TMDL Plan, has calculated the percentage reduction of pollutant concentrations in storm water discharges from Outfall 013 based on the analytical results of the September 12, 2013 storm water sampling (see attached). AMEC's calculations showed a significant decrease in metal concentrations in storm water discharges from Outfall 013 compared to baseline concentrations. Specifically the following percent reductions were obtained: Cadmium – 100%, Copper – 45%, Iron – 83%, Lead – 48%, and Zinc – 82%.

We have not identified any specific reason for the September 2013 permit excursions, although we are continuing to investigate possible causes. We note that the concentrations of copper and zinc measured at Outfall 013 were lower for the September 2013 sampling event than for the prior sampling event in June of 2013. We are also evaluating additional measures to further reduce pollutant concentrations and to help achieve consistent compliance with the permit limits. The next step includes implementation of Phase III control measures as identified in the TMDL Plan (i.e., installation of additional LID structures).

Please contact me at (703) 253-1787 or by electronic mail at mwilliams@pepcoenergy.com if you need additional information.

Respectfully yours,

Michael V. Williams

Notes:

cfs - cubic feet per second
NA - Not applicable

⁽¹⁾ Pollutant concentration was not detected. Concentration used in pollutant load calculation is set to zero.

⁽²⁾ Flow was measured when samples were collected.

⁽³⁾ Not required by 2009 NPDES Permit for Benning Generating Station.

⁽⁵⁾ No maximum daily limit is listed. Value is the Maximum Daily Stormwater Discharge Concentrations Goals for Metals listed in Section VIII.E of the 2009 NPDES Permit for Benning Generating Station.

⁽⁷⁾ Positive values indicates that the September 2013 concentrations are lower than the maximum daily limit for the pollutants.

⁽⁸⁾ Positive values indicate that the September 2013 concentrations/loads are lower than the baseline concentrations/loads.

⁽⁹⁾ There were no detections of PCB Aroclors. Therefore, a baseline flow was not established. However, given that the concentration of PCB Aroclors is zero, the load is also zero regardless of flow.

⁽¹⁰⁾ Baseline concentrations are based on the highest concentration listed on DMRs for Outfall 013Q from 2005 to 2007. TSS was not reported on DMRs until 2009. Therefore, the baseline concentration for TSS is from the highest concentration listed on the Jul-Sep 2009 to 2010 DMRs for Outfall 013Q.
